

User Flow per Fitur

Dokumen ini menjelaskan alur pengguna pada MVP dan alur API yang menjadi dasar halaman lanjutan.

Legenda: [User] tindakan pengguna, [UI] frontend, [API] backend, [DB] database, [Decision] percabangan.

1. Membuka dashboard contractor

2. Filter contractor

3. Refresh dashboard

4. CRUD master data

Aturan penting: contractor code harus unik, equipment quantity harus > 0 , dan fuel reference values harus > 0 .

5. Kalkulasi Loading

Batch Loading menerima daftar **rows** dan mengembalikan total fuel, total productivity, dan fuel ratio agregat.

6. Kalkulasi Hauling

7. Kalkulasi Supporting/Dewatering

Batch `calculate-all` menjalankan flow untuk seluruh equipment dalam aktivitas terkait.

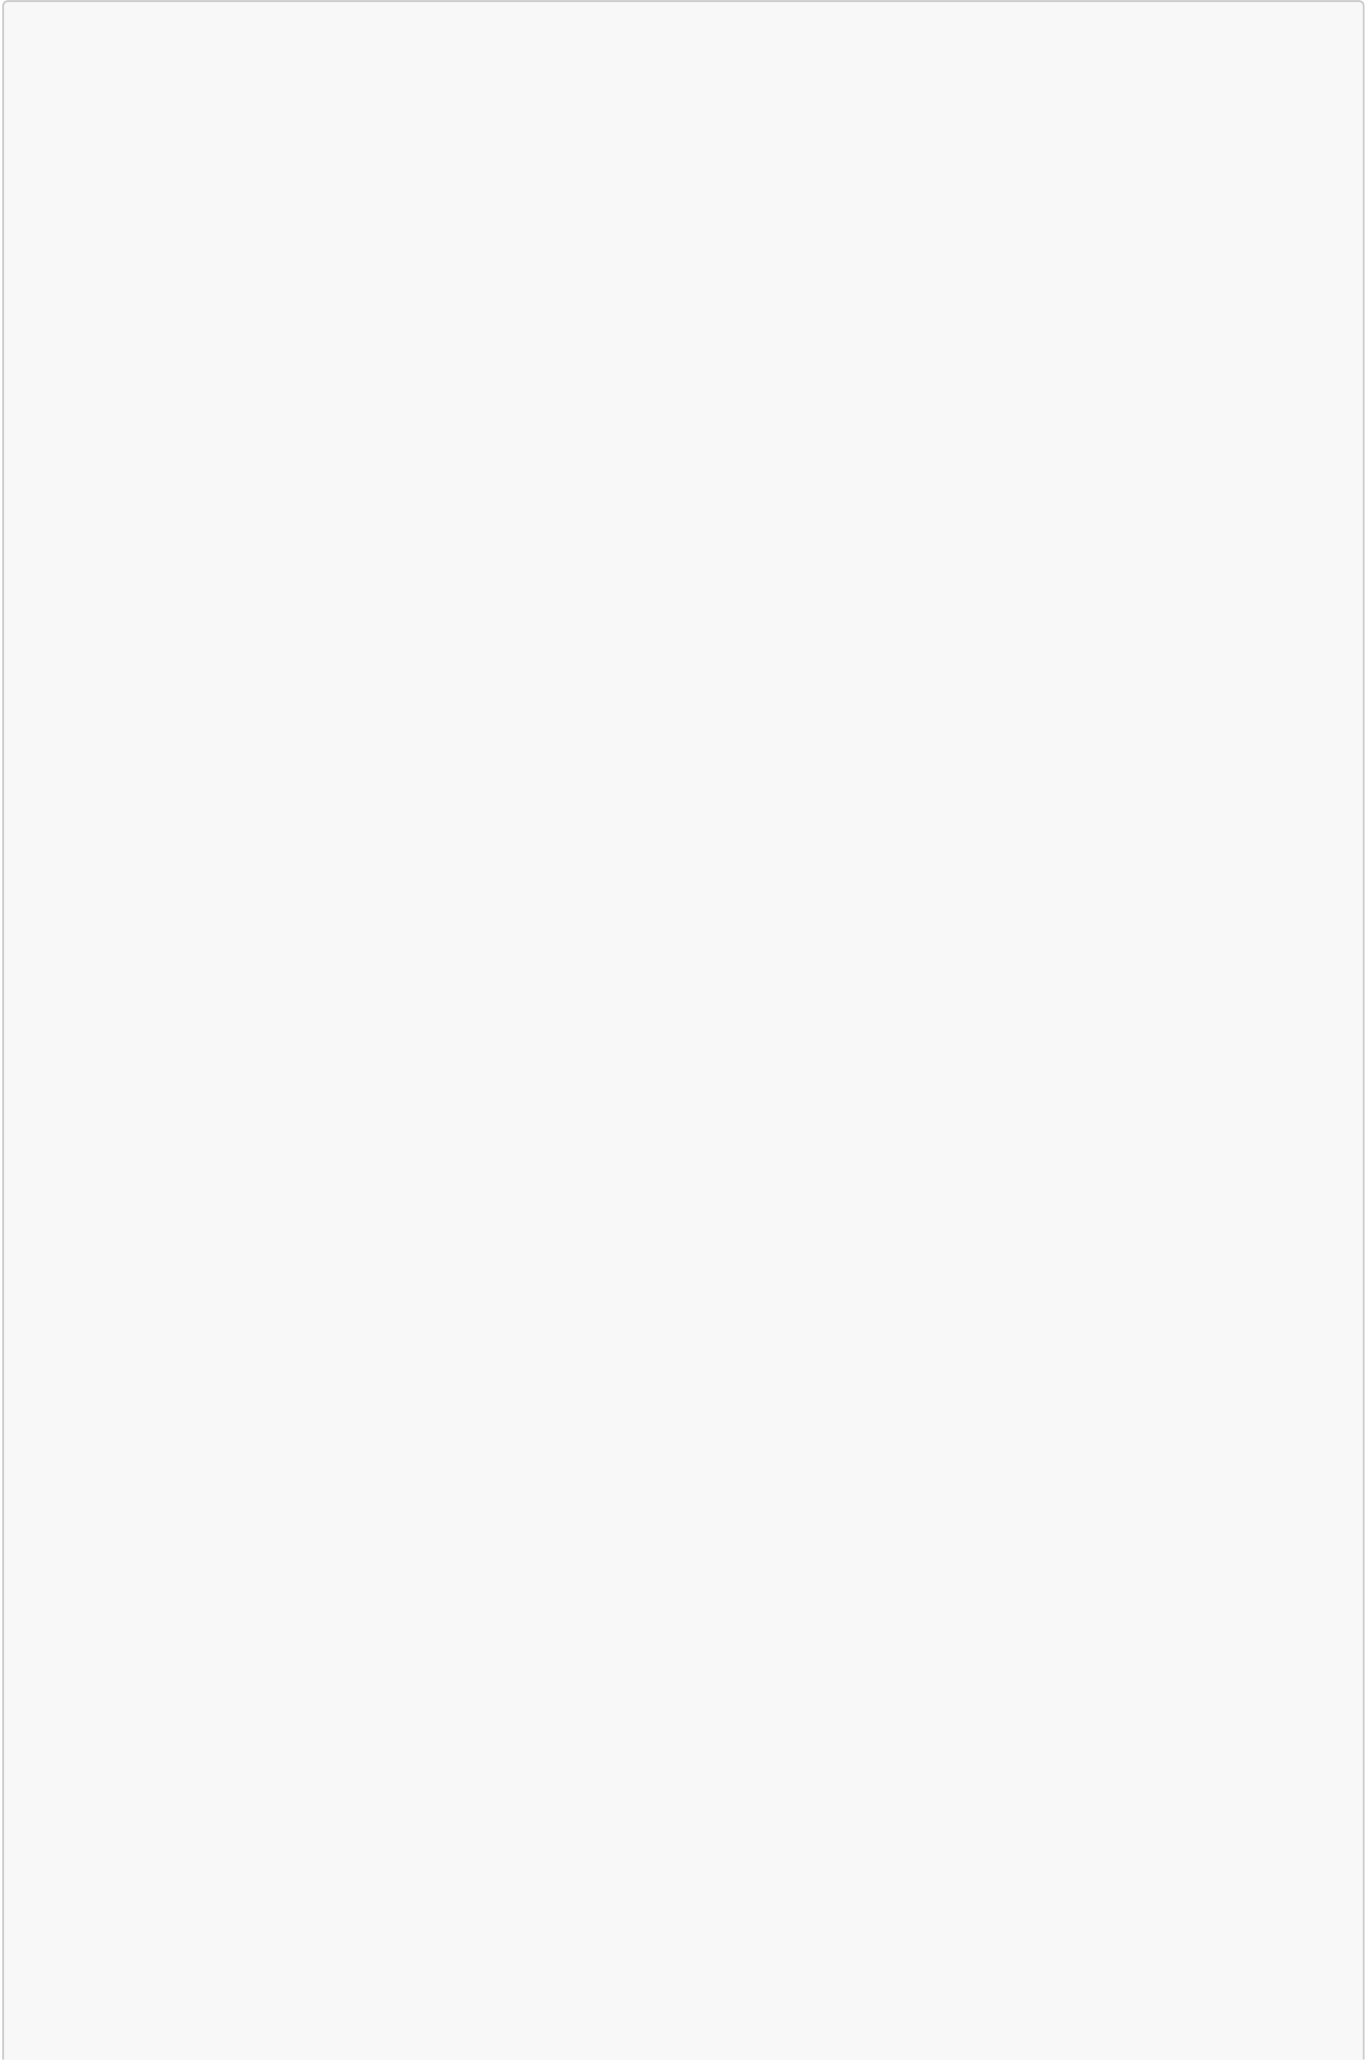

8. Monitoring per aktivitas dan filter

Syntax error in text
mermaid version 11.16.1

Filter tanggal hanya membatasi trend karena unit register belum memiliki tanggal transaksi individual.

9. Contractor performance dan fuzzy risk

Fuzzy risk adalah sinyal prioritas, bukan keputusan otomatis untuk penalti contractor.

10. SPO alignment

Summary operasional

Simulasi

11. Seed dan maintenance database

Seeder hanya untuk database demo/local karena bersifat destruktif.

12. State dan error yang wajib ditampilkan UI

Setiap flow frontend harus menyediakan:

- loading state saat request berjalan;
- empty state bila array kosong;
- error state untuk 404, 409, dan 422;
- tombol retry untuk error network/server;

- notifikasi sukses setelah mutasi data;
- konfirmasi sebelum delete atau operasi seed.
